DX Simulator for Macintosh (Stand alone)

Thank you for your support of Yamaha products.

DX Simulator is a software application for the and PLG150-DX Modular Synthesis Plug-in System boards, which allows you to edit, save and transmit voices through MIDI. Users who are already familiar with the DX7 will feel right at home using this software thanks to its “virtual DX7” editing window and an Edit List window that lets you see all the parameters at a glance.

Do not use the platform synthesizer (MOTIF/S80, etc.) while editing the PLG100-DX or PLG150-DX with this software, as doing so may cause the edited parameters to change.

System requirements

• Computer platform	Apple Macintosh PowerPC
• Operating system	Mac OS 8.0 through 9.1 is supported
